

Min and Max Challenge

All right. So it's time for your next challenge.

This is the minimum and maximum challenge.

So this challenge is similar to the last one in some ways.

Min and Max Challenge

You'll be using an endless loop which:

- Prompts the user to enter a number, or any character to quit.
- Validates if the user-entered data really is a number, you can choose either an integer, or double validation method.
- If the user-entered data is not a number, quit the loop.
- Keep track of the minimum number entered.
- Keep track of the maximum number entered.

If the user has previously entered a set of numbers (or even just one), display the minimum, and maximum number, which the user entered.
